I. WORK SUMMARY

This update focused on small but meaningful user experience improvements using the existing data model and frontend architecture.

V. NEXT STEP

The next step is to continue improving small UX elements such as retry actions in error panels, active navigation indicators, and more refined player feedback.

II. COMPLETED CHANGES

A. *Continue Watching Row*

- Integrated watch history into homepage data flow.
- Filtered partially watched and incomplete titles.
- Displayed these titles in a dedicated *Continue Watching* row before the main catalog rows.

B. *Player Loading Feedback*

- Added buffering state tracking in the player component.
- Added a loading spinner overlay while the stream is initializing or waiting.
- Hid the loading state automatically once the media is ready to play.

C. *Search Result Count*

- Added visible result count text for homepage search mode.
- Added matching result count text for the dedicated search route.

III. VALIDATION

- Verified that the homepage still renders correctly with the new row logic.
- Verified that the player spinner appears only during loading and buffering states.
- Verified that the search count updates with returned query results.
- Confirmed that the frontend production build completes successfully after these changes.

IV. OUTCOME

These changes improved the platform in three ways: better homepage personalization, clearer player feedback during startup, and stronger search visibility. The work was completed with minimal code surface change and no schema modification.
