I. SUMMARY OF PROGRESS

This week's work focused on stability and usability improvements in authentication, search, and deployment readiness.

II. COMPLETED WORK

A. Authentication and Navbar Stability

- Eliminated navbar flicker by server-seeding auth state on initial render.
- Added frontend bearer token support to avoid cross-origin cookie limitations.
- Ensured logout clears frontend auth state consistently.

B. Search Quality

- Implemented fuzzy, relevance-ranked search on the backend.
- Search now returns close matches for typos and partial queries.

C. Deployment and Build Readiness

- Fixed Next.js build error related to server cookie handling.
- Verified successful production build locally.

III. ISSUES RESOLVED

- Removed temporary auth loading indicator that appeared on first load.
- Ensured backend supports Authorization header in addition to cookies.

IV. VALIDATION

- Frontend build succeeded after fixes.
- Auth state now persists through reload without showing login/signup.
- Search returns relevant results even with non-exact queries.

V. NEXT STEPS

- Monitor auth state changes in production after redeploy.
- Tune search ranking weights based on user feedback.
- Continue testing edge cases in watch history and trending endpoints.
