I. WORK SUMMARY

This week's work focused on refining the visual quality and consistency of the streaming platform interface. The goal was to improve polish without changing application architecture or core business logic.

II. COMPLETED TASKS

A. Interactive UI Refinements

- Added smoother hover motion and elevation to movie cards.
- Improved navbar button transitions and visual feedback.
- Added stronger keyboard focus rings for accessibility.

B. Consistency Improvements

- Standardized section title styling.
- Standardized metadata text appearance.
- Added reusable panel styles for status and content surfaces.

C. Empty and Error States

- Replaced plain text error messages with styled fallback panels.
- Improved search no-results state.
- Improved watch history empty state with clearer guidance.
- Improved homepage error presentation.

D. Skeleton Loading System

- Reworked skeleton components to use a shared shimmer effect.
- Unified spacing, corner radius, and appearance across loading routes.
- Applied consistent loading visuals to home, history, search, auth, player, and more-info pages.

III. TESTING AND VALIDATION

- Verified that the frontend production build completes successfully.
- Confirmed that the updated components preserve existing functionality.
- Checked that loading, empty, and error states now follow a consistent visual pattern.

IV. OUTCOME

The application now presents a more cohesive and production-ready interface. Although the underlying functionality remains the same, the improvements increase perceived quality, improve feedback during edge cases, and align the platform more closely with modern streaming UI expectations.

V. NEXT STEP

The next step is to continue refining small UX details in player interactions, mobile navigation, and component responsiveness while maintaining the same design language introduced in this update.
